Publication and Citations within Bioscience in Norway
A comparison between Norway and other countries, based
on the National Science Indicators on Diskette (NSIOD)

NIFU skriftserie nr. 8/99

Preface

This report presents a bibliometric analysis of Norwegian research in *Biosciences*. It gives a picture of the overall publication activity and visibility of Norwegian research in a set of scientific fields considered relevant to *Biosciences* compared to other countries.

The report is a result of a project commissioned by the Research Council of Norway, Science and Technology Division, as a contribution to the national evaluation exercise of Norwegian *Biosciences*.

1 Introduction

Bibliometric R&D indicators measure the extent of 1) *publishing* in international scientific journals and 2) the extent to which these papers have been referred to or *cited* in other papers in the same journals. In the following we will present tables and figures with publication and citation statistics in fields of science considered by the *Research Council of Norway* to be relevant for the biosciences, comparing Norway to a selection of other countries.

2 Data source

The *National Science Indicators On Diskette (NSIOD)* is a database with aggregated publication and citation statistics which cover about 170 countries, i.e. almost the whole world, through the 1981-98 period. Statistics are also available for the geopolitical regions Asia Pacific, European Union and Latin America. In the standard version of NSIOD, which has been applied for the present analysis, the papers are classified in 24 fields of science; most of these belong to the natural sciences and technology. However, a few of the social sciences are also included. NSIOD is published by the *Institute for Scientific Information (ISI)*, in Philadelphia, USA, a commercial enterprise which also publishes the *Science Citation Index (SCI)*, the *Social Science Citation Index (SSCI)*, and the *Arts & Humanities Citation Index (AHCI)*, as well as several other bibliometric products on scientific publishing.

All the fields of science in the NSIOD standard database are listed alphabetically below:

- Agricultural Sciences
- Astrophysics
- Biology & Biochemistry
- Chemistry
- Clinical Medicine
- Computer Science
- Ecology/Environment
- Economics & Business
- Education
- Engineering
- Geosciences
- Immunology
- Law
- Materials Science
- Mathematics
- Microbiology
- Molecular Biology & Genetics
- Multidisciplinary
- Neuroscience
- Pharmacology
- Physics
- Plant & Animal Science
- Psychology/Psychiatry
- Social Sciences, general

A field of science is defined by the journals that are classified under the field. Each journal is generally classified under *one* field.¹ All papers in a journal are regarded as belonging to that journal's field of science.² Annex 4 presents a list of the journals from which the papers in the NSIOD that are relevant for the present analysis, have been counted.

¹ A few journals have, however, been classified under 2 – or, exceptionally – 3 fields, see Annex 3.

² There are exceptions here also, see the introduction to Annex 4.

In the database that is the foundation for the present analysis, it is not possible to split up the fields of sciences into more narrow categories.³ The data are aggregated at a national level, which makes it possible to compare between countries for different fields of science. Using NSIOD it is not possible to break down national data, neither to individuals nor institutions/institutes.⁴

The number of journal papers can be considered as an indicator of scientific *productivity*. The number of citations can be seen to be an expression of the extent to which the publication has been *recognised* by, or made *visible* to, colleagues in science. There is general agreement among bibliometricians that extreme care should be given not to interpret publication and citation frequencies as measures of research *quality*. On the other hand, bibliometric data can be useful as background data in evaluations, e.g., of a field of science or a research unit.

In the following we will present – by tables and figures – a survey of the extent of Norwegian publishing within a selection of nine fields considered by the Research Council of Norway to be relevant for the on-going evaluation of Norwegian biosciences, and do comparisons with publishing activities in a selection of other countries. We also present data on citation indicators, such as *Citation impact* and *Relative citation impact*, see p. 10. Five of the selected fields may be considered essentially natural sciences and four essentially medical sciences. The borderlines between the fields are not clear-cut, however, neither in epistemological nor operational terms. E.g., some journals are included in more than one category. The selected fields are:

Natural sciences:

Biology & Biochemistry
Ecology/Environment
Microbiology
Molecular Biology & Genetics
Plant & Animal Science

Medical sciences:

Clinical Medicine
Immunology
Neuroscience
Pharmacology

The journal based field classification provides statistics that may differ from statistics with a different classification base. Ideally, one would prefer to identify the subjects by classifying the single papers, not only the journals. A study of microbiology⁵ reveals that even if the journals included in NSIOD cover almost all papers published by Norwegian microbiologists, only about 40 per cent of the papers were published in journals classified as *Microbiology*. Most papers were published in journals classified in *other* NSIOD fields, for example,

³ We have used the standard version of NSIOD. There is also a "DeLuxe" version with more narrow defined subfields – 104 categories in all. NIFU has, however, not bought the "DeLuxe" version. In Annex 3 we show the relationship between the two field classification systems.

⁴ NIFU has another ISI-database where this is possible, but for Norwegian papers only. The National Citation Report (NCR) for Norway encompasses all papers in ISI-indexed journals with "Norway" in the authors' address field of the base. Provided further development of the data base is undertaken, the NCR makes possible in-depth bibliometrical analyses. Norwegian researchers' publication patterns can be analysed at an institutional, institute and personal level. In addition, these disaggregated data contain information about the journals in which the papers are published and about co-authorship, i.e. who publishes with whom.

⁵ Aksnes D.W., Olsen T.B., Seglen P.O: *Inadequacy of a journal-based field delineation. Incomplete recovery of Norwegian microbiology articles in ISI's Microbiology field*, proceedings paper at the 7th conference of the International Society for Scientometrics and Informetrics, Colima, Mexico, July 1999.

Clinical Medicine and *Plant & Animal Science*. However, microbiology may be exceptional in this respect, an underrepresentation like this does not necessary occur in other fields to the same extent.

In general, there are many precautions to be taken when interpreting bibliometrical statistics; some warnings against misinterpretations are presented in Annex 2.

In the following, we present tables and figures on publications and citations⁶. In general, they will speak for themselves. Some explanations and comments, however, are presented in the following text sections.

3 The total period 1981-98

During the period 1981-98 more than 10 million papers were published in the journals included in the database. Of these, about 58,000 had one or more authors with a Norwegian address. These "Norwegian" papers represent 0,6 per cent of all papers in the world, see Table 1, which lists a selection of countries to which Norway will be compared in this report. These 22 countries cover around 90 per cent of all papers in the world.

Table 2 shows Norwegian papers within all fields of science in the database. The selected biosciences (italicised) represent more than 60 per cent of all Norwegian papers. *Clinical medicine* is by far the greatest field by number of papers. Clinical medicine alone covers almost 30 per cent of the papers. Figure 1 illustrates relative size of the selected fields.

In the Table 3 we look more closely at the selected fields in biology and medicine. The nine fields are presented in separate tables. This is the subnumber system of the tables, which also applies in the figures:

1. Biology & Biochemistry
2. Ecology/Environment
3. Microbiology
4. Molecular Biology & Genetics
5. Plant & Animal Science
6. Clinical Medicine
7. Immunology
8. Neuroscience
9. Pharmacology

⁶ Annex 1 gives a list of all tables and figures in this paper.

Table 1 Papers and citations for selected countries, 1981-1998. All fields of science.

Country	Number of papers	Percent- age of world total	Cited papers	% cited papers	Number of citations	Citation impact	Relative citation impact
US	3 829 448	38,1	3 034 238	79,2	56 267 471	14,69	1,44

¹⁾ I.e. the about 170 countries included in the database. The number of papers and citations for the countries will sum up to more than the world total and the percentages to more than 100 because of co-authorships across the countries.

In Table 3 figures per country are presented on the following indicators:

- All papers in the field in absolute figures.
- All papers in the field as percentage of all papers in the country.
- *Relative publication index*, defined as field's percentage of the total number of papers in the country, divided by the field's percentage of the total number of papers of all countries in the database.
- Cited papers in absolute figures.
- Cited papers as percentage of all papers.
- All citations in absolute figures.
- *Citation impact*, which is the number of citations divided by the number of papers.
- *Relative citation impact*, which shows the relation between the field's citation impact in individual countries and the citation impact for the field worldwide when all countries are included (the impact base in the table). The relative citation impact for a field in a particular country thus has the value of 1 if the country's papers are cited to the same extent as all papers worldwide in the field.

Table 2 Norwegian papers by field of science, 1981-1998

Field of Science	Number of Norwegian papers	Percentage Norwegian papers of all papers in the field	The field's percentage of all Norwegian papers	The field's percentage of all papers in the world

Total ¹⁾	58 321	0,58

Source: NIFU Data: National Science Indicators/Institute for Scientific Information

¹⁾ The number of papers sums up to more than the total and the percentages to more than 100 because some of the journals are classified under more than one field.

In Table 3 the countries are ranked according to the number of papers. As can be seen, Norway ranks as number 16 or 17 of the total 22 countries in all the fields. Not considering Iceland, the number of Norwegian papers is below the other Nordic countries in *all* fields except *Plant & Animal Science* where Norway is ahead of Finland.

The number of articles of a country is, of course, related to its size. Figure 2 shows article production per million inhabitants. To give an idea of the development of the field, data for three years (1981, 1990 and 1998) have been included. Compared to other countries, Norway scores high on this indicator in *Plant & Animal Science* and, like all the Nordic countries, in *Ecology/Environment*.

In Figure 3 the country's papers within a field is displayed as a percentage of all the country's papers. This gives an impression of the field profiles of the countries. For Norway the shares of *Plant & Animal Science* and *Ecology/Environment* are larger than for any of the other countries. *Clinical medicine* weights heavily for Norway as for all the Nordic countries.

The Nordic countries are in focus in Figure 4, which shows the relative publication index for the selected nine biosciences. A relative publication index value of 1 means that the field's percentage of the total number of papers in the country corresponds to the field's percentage of the world total. As shown in the figure Norway has about 80 per cent more papers than "expected" in *Ecology/Environment* and *Immunology*, and about 50 per cent more in *Plant & Animal Science*. Compared to the other Nordic countries Norway scores high in

those three fields, and low primarily in *Molecular Biology & Genetics* and *Pharmacology*, but also in *Microbiology, Biology & Biochemistry* and *Neuroscience*.

Looking at the relative citation impact, see Figure 4, we find that Norway ranks low or medium in all the fields except *Ecology/Environment*. *Ecology/Environment* and *Plant & Animal Science* are the only fields with impact values above 1 for Norway.

Table 3.1 Papers and citations within Biology & Biochemistry for selected countries, 1981-98

Country	Number of papers	% of all papers in the country	Relative publication index	Cited papers	% cited papers	Number of citations	Citation impact	Relative citation impact	Impact base

4 Time trends

Figure 6 and Figure 7 show the development for Norway during the 18-year period 1981-98 of the number of papers within the nine selected fields of science. *Plant & Animal Science* and *Clinical Medicine* show the strongest increase during the period. *Ecology/Environment* has a considerable growth in the end of the period. *Microbiology* had a decrease in the end of the eighties, and then started to increase again.

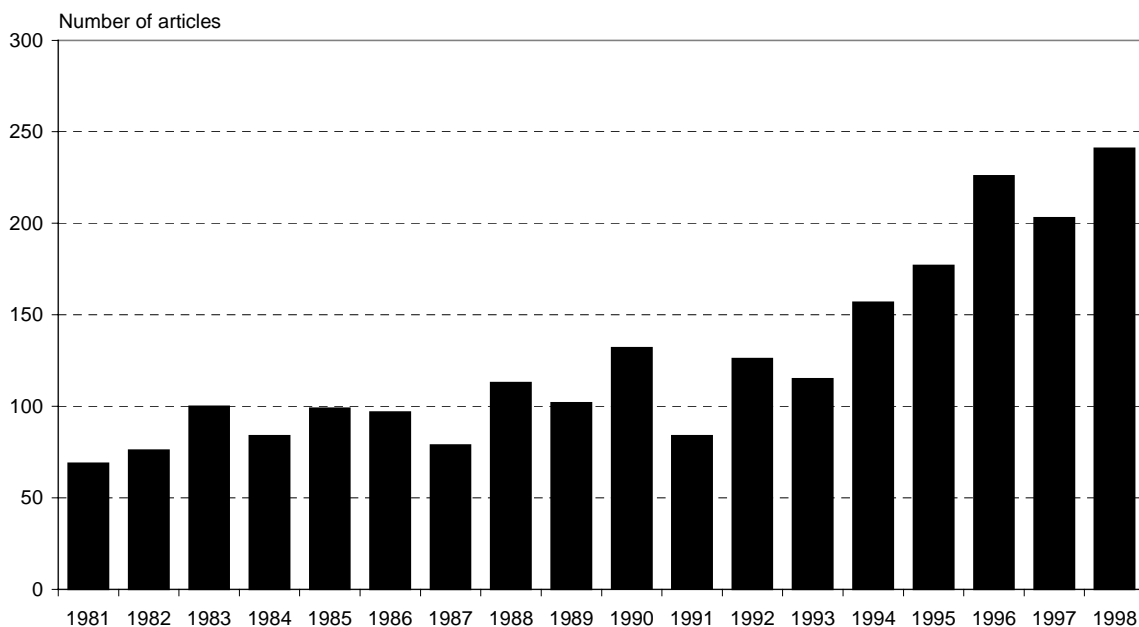

In Figure 8 the development in the relative citation impact during the period is shown for the Nordic countries. The trend differs from field to field. For the two fields in which Norway scores higher than 1 for the whole period altogether, *Ecology/Environment* and *Plant & Animal Science*, there has been a declining trend from the mid-nineties. By the end of the period Norway ranks lowest among the Nordic countries in five of the nine fields. See, for example, the development within *Clinical Medicine*. On the other hand, there has been a positive trend both in *Microbiology* and *Neuroscience* during the nineties.

Annex 2 Some warnings

Care should be taken when interpreting bibliometrical indicators.

In the bibliometrical literature the strength and weakness of such indicators are frequently discussed. Here are some of the issues – not at all a complete list! – of which one should be aware when interpreting the statistics and data presented in this analysis.

- ◆ The ISI databases are produced in the US. Which journals to be indexed is decided by ISI, who claims to cover the leading journals in the world within the different fields of science. The journal list is available, and everybody may assess how the representative the selected journals are. Annex 4 lists the journals of the relevant fields in the present analysis.
- ◆ Some critics contend that the selection of journals is skewed because of the language – journals published in English are overrepresented in the database compared to journals in other languages. Against this it is argued that as international orientation is a criterion for a journal to be included in the database, it is just to be expected that the lot of the journals are in English.
- ◆ Another argument says that the journals selected in essence reflect fields of science that are more or less firmly established. It takes time for journals in upcoming or recently established fields to be included, i.a. because the data base require time series.
- ◆ International journal publishing is not equally relevant for all fields of science. In the humanities and most of the social sciences, for example, the research results are published primarily in other publication types than international scientific journals. In many subfields, monographs, locally oriented journals, report series, etc., may be more appropriate and important media for presenting the research results than international journals.
- ◆ But even within the natural and technological sciences there are variations in the degree to which the most relevant journals have been included in the database. Physics, chemistry and biomedicine are fields in which most of the publishing is concentrated within a relatively well defined set of dominant and leading journals – which also receive most citations. All these journals are included in the ISI databases. In biology and geosciences, on the other hand, a greater share of the papers are more often published in nationally or locally oriented journals, which to a lesser extent – and in a more casual and unsystematic way – are covered by the databases. In technology, humanities, and most of the social sciences journal publishing seems to be less crucial than in the hard basic sciences.
- ◆ As for citation counts, it is not generally agreed upon what the figures actually express. There may be different motives for citing, and citing behaviour may vary considerably between different fields and different segments of the scientists' community. Citation counts are, therefore, not necessarily numerical expressions for the quality of the scientific literature, but more likely for its impact or usefulness in one sense or another.
- ◆ The inclination to cite fellow scientist from one's own country varies from country to country, and seems most pronounced among the US scientists. This affects the relative citation indexes also for other countries.
- ◆ In addition, one should be aware of different technical and methodological problems of measuring – like printing and spelling errors, synonyms (which may result in double-counting), or homonyms (the problems concerning different authors with identical names), etc.

Annex 3 Fields and journals in NSIOD

All journals have been classified according to field categories corresponding to the categories of *Current Contents*. *Current Contents* is a database displaying the tables of contents from scholarly journals and provides bibliographic data for journal articles, etc. *Current Contents* is published weekly in seven editions. Each edition covers related fields of science. In this annex the correspondence between the *NSIOD* standard version codes and the *Current Contents* categories is displayed. The codes in the DeLuxe version of *NSIOD* are identical to the *Current Contents* categories.

Within the one and same *Current Contents* Product Code (or edition) a journal can be counted only once. However, sometimes a journal may have been included in two or more product codes, e.g. both in *Life Sciences* and *Agriculture, Biology & Environmental Sciences*, if the journal has been found relevant to both products. In this case the journal has been included in the *NSIOD* data more than once, which makes double or triple counting.

A different sort of double counting arises from the fact that many articles have authors from more than one country. In these cases the article has been counted once for each country represented among the authors.

Annex 4 Journals in Biosciences in NSIOD

This is a list of the scientific journals of the nine fields in the NSIOD 1998 standard version considered relevant for the biosciences. The NSIOD data, in addition, include relevant papers appearing in the multidisciplinary journals NATURE, SCIENCE, and PROCEEDINGS OF THE NATIONAL ACADEMY OF SCIENCES OF THE UNITED STATES OF AMERICA.

Field of science	Page
Biology & Biochemistry (311 journals)	52
Ecology/Environment (166 journals)	54
Microbiology (84 journals)	55
